<sup>i</sup> Assumptions: The offset fee calculation is based on the following three assumptions

- The onsite emissions per participant are estimated at 0.29t (2000t in total divided by an estimated number of 6900 participants).
- To calculate the average CO<sub>2</sub>e emissions linked to the air travel for participants an online carbon calculator was used <http://www.carbonfootprint.com/calculator.aspx>. The carbon footprint calculator is taking into account indirect distances, and the following emission factor for long haul and short haul flights: 0.1056 t CO<sub>2</sub>e/km for long haul and 0.1304 t CO<sub>2</sub>e/km for short haul flights. The following averages have been calculated:
  - Europe 1.64 tons CO<sub>2</sub>e per person;
  - Oceania 1.41 tons CO<sub>2</sub>e per person;
  - North America: 2.06 tons CO<sub>2</sub>e per person;
  - Central America: 2.52 tons CO<sub>2</sub>e per person;
  - West and Central Africa: 2.3 tons CO<sub>2</sub>e per person;
  - Eastern Africa: 1.79 tons CO<sub>2</sub>e per person;
  - Southern Africa: 2.18 tons CO<sub>2</sub>e per person;
  - Southern Cone of S. America: 3.28 tons CO<sub>2</sub>e per person;
  - Rest of S. America: 2.65 tons CO<sub>2</sub>e per person;
  - West Asia 1.27 tons CO<sub>2</sub>e per person;
  - Japan: 0.25 tons CO<sub>2</sub>e per person;
  - China: 0.23 tons CO<sub>2</sub>e per person; and
  - Seoul: 0.09 tons CO<sub>2</sub>e per person.
- The price paid per ton of CO<sub>2</sub> equivalent for purchasing offsets is based on current prices for high quality third party validated or verified emissions reductions (VERs) in the voluntary carbon market. IUCN prioritises VERs from land based carbon projects, which demonstrate significant biodiversity and social benefits and is set at 15CHF/ton CO<sub>2</sub>e.
