About IUCN

IUCN is a membership Union uniquely composed of both government and civil society organisations. It provides public, private and non-governmental organisations with the knowledge and tools that enable human progress, economic development and nature conservation to take place together.

Created in 1948, IUCN is now the world's largest and most diverse environmental network, harnessing the knowledge, resources and reach of more than 1,400 Member organisations and some 18,000 experts. It is a leading provider of conservation data, assessments and analysis. Its broad membership enables IUCN to fill the role of incubator and trusted repository of best practices, tools and international standards.

IUCN provides a neutral space in which diverse stakeholders including governments, NGOs, scientists, businesses, local communities, indigenous peoples organisations and others can work together to forge and implement solutions to environmental challenges and achieve sustainable development.

High time for Innovative High Seas Finance

The conservation and sustainable use of marine biological diversity in the ocean beyond national jurisdiction, as described under the IUCN WCC-2020-Res-128¹, require expeditious identification, establishment and management of an ecologically representative, well-connected, well-managed network of effective Marine Protected Areas (MPAs), including a substantial portion of which are highly and fully protected, and other area-based management tools (ABMT). Fully including such protection of the High Seas will be required if we are to meet the global target of protecting at least 30% of the ocean² as part of a healthy interconnected seascape that mitigates the impacts of ocean use, as being discussed under the United Nations Convention on Biological Diversity (CBD)'s Post-2020 Biodiversity Framework.

Studies³ are indeed suggesting vast benefits of such measures, provided they are underpinned by an effective financial support and a

robust, equitable, flexible and multi-pronged mechanism for financing implementation. The cost of inaction would far exceed the costs of establishing such a mechanism^{4,5}.

An upfront financial commitment to help deliver BBNJ ambition

This policy brief suggests that we can be bold, visionary and pragmatic⁶ by complementing the finance approach suggested under Article 52.3 of the BBNJ further revised draft text with a dedicated upfront funding commitment. This will allow to deliver the promise made by the High Ambition Coalition on Biodiversity beyond National Jurisdiction⁷, which is to “recognize the contribution of such BBNJ Treaty to the protection by 2030 of at least 30% of the Ocean and seas through an ecologically representative, well connected network including of highly, and fully protected marine areas and area-based management tools.”

Art.52.3. of the BBNJ further revised draft text⁸ now states:

The mechanism shall include:

[...]

(b) A special fund established by the Conference of the Parties that shall be funded through assessed contributions from Parties [...] and open to additional contributions from Parties and private entities wishing to provide financial resources [...]

8 Note of the President of A/CONF.232/2022/5 1 June 2022, <https://documents-dds-ny.un.org/doc/UNDOC/GEN/N22/368/56/PDF/N2236856.pdf?OpenElement>

IUCN has proposed⁹ that such a special fund also requires an **appropriate institutional mechanism**, and supports a public-private partnership approach, coordinated by a **Standing Committee on Finance** under the BBNJ COP.

Delivering a New Blue Deal for the Sustainable Development Goal (SDG) 14 in the High Seas¹⁰ requires an early upfront investment to set a path to benefits and potential future revenue streams. The proposed partnership approach would allow for effective implementation from an early stage and would help to transition to a stable BBNJ funding model over time. An Ocean Sustainability Bank¹¹ can provide integrative financing tools to effectively address the ocean finance gap not only for BBNJ but throughout the global ocean, helping to deliver SDG14 and a sustainable blue economy for a new blue deal that addresses ocean, climate and biodiversity challenges in a **just** transition based on principles of equity, informed decision-making, shared responsibility and accountability.

Investing US\$500million into robust BBNJ implementation

Effective BBNJ conservation measures rely on a range of inputs, including a process of scientific assessment and identification of areas, baseline research and discussion. Proposals will need to be taken through the BBNJ ABMT designation process, with comprehensive stakeholder engagement, in particular from relevant sectoral

and regional bodies (“SRBs”)¹². Once measures have been adopted, areas need to be monitored, both for potential infractions and to deliver appropriate dynamic ecosystem management. A robust system will require both physical (sensors, satellites, etc.) and institutional (staff, data, reporting, etc.) infrastructure, with capacity building throughout¹³.

Whilst the total cost of establishment and operations of such measures will be significant¹⁴, the proposed BBNJ Agreement assumes that a significant part of the cost will be covered by State Parties, either directly, or through capacity-building support funded through assessed contributions to the special fund, or through memberships in SRBs which will implement such measures¹⁵.

This policy brief focusses on measures that need to be immediately started, including prior to ratification of the Agreement, such as efforts of States and scientists in developing ABMT proposals, capacity building in developing countries¹⁶ to allow for full participation in this process including through civil society, and innovative measurement, reporting and verification (MRV) solutions¹⁷. Research¹⁸ has identified initial areas covering 6% of the High Seas that could serve as initial pilots. For example, the Sargasso Sea¹⁹ offer insights into approaches and management options²⁰, including a thorough budgeting process.

Multiple potential future revenue streams

Effective and rapid protection of High Seas biodiversity delivers significant economic value in the form of ecosystem services far in excess of cost. This blue natural capital value, from fish nurseries to blue carbon²¹ to ecosystem resilience, is increasingly being captured in ocean accounts²². The value at risk from exploitation of the ocean is significant²³.

Public budget allocations, tourism fees, and donor-supported conservation trust funds are commonly employed financial mechanisms for marine protection. The Seychelles, for example, designated 30% of its territorial waters as MPAs, supported by donors, and are bridging the financing gap and engaging local stakeholders in ocean conservation²⁴.

Improved regulation, abolition of destructive subsidies and appropriate pricing of carbon can help to deliver better ocean outcomes. BBNJ implementation by 2030 needs to be robust and based on delivering connectivity, thus providing network effects. This would accelerate the channeling of additional private sector financial contributions.

Potential sources of direct payment streams to BBNJ management may include:

- **Access fees**, for instance from those entering protected areas (similar to those presently charged for instance to divers in national MPAs);
- **User fees**, including from those that directly rely on BBNJ data infrastructure,

for example where operational benefits can be delivered such as optimal routing;

- **Royalties on revenues from conservation and restoration activities** (where a private entity is contracted to deliver services and delivers incremental value);
- **Sale of allocations of benefits of ecosystem services**, such as potentially around blue carbon; and
- **Taxation of sustainable activities** that take place in marine Areas Beyond National Jurisdiction (ABNJ).

Conserving 30% of global ocean in Marine Protected Areas could create 1 million jobs, sustain fish catch worth US\$70–80 billion/year and provide ecosystem services with a gross value of roughly US\$4.5–6.7 trillion/year²⁵. Given the scale of the benefits not just economically but for society as a whole, more value is lost annually by any further delay in adequate protection than is likely to be recouped through financial flows later on.

The approach proposed here of an early, defined upfront investment not only helps to protect this value immediately, it also provides time to flexibly assess, through the Standing Committee on Finance under the BBNJ COP, if, how and when additional funding streams should be integrated into the BBNJ architecture.

Partnerships for BBNJ Progress

The new language in the further revised draft text on additional contributions from Parties and private entities²⁶ provides an entry point for innovative financing partnerships²⁷

based on an ecosystem approach²⁸. Proactively engaging a wider range of partners and stakeholders can deliver results without overburdening institutional arrangements²⁹ and allow to work complementarily to ensure effective implementation. Similarly to the innovative financing used by the Global Alliance for Vaccines and Immunisation (Gavi)³⁰, such a BBNJ multi-stakeholder coalition, gathering finance, tech, conservation, philanthropies and governments actors, could not only contribute funding, ideas and skills, it could also use formats such as advanced market commitments (AMC), matching funds³¹, and High Seas blue bonds secured on guaranteed payments.

Technologies such as remote sensing via satellites, subsea devices such as buoys and SMART subsea cables³² and eDNA analysis represent multiple mechanisms to monitor the High Seas, collect important data, enforce protected areas and deliver sea basin approaches to integrated observing systems³³. Such tools can be used to help analyse future climate change impacts³⁴ which if not taken into account could limit the effectiveness of ABMTs³⁵. By engaging relevant organisations directly in the partnership, agreeing on joint development and providing long-term funding commitments for specific use cases, these approaches can be rapidly deployed, scaled and de-risked.

As mentioned above this work needs to commence ahead of the BBNJ Agreement ratification³⁶ and require support of a “coalition of the willing”, similar to the concept of climate clubs as proposed by the German G7³⁷. Different organisations can play a role in facilitating such partnerships. IUCN for instance is well-suited to coordinate work around ABMT standards and design, and could therefore be tasked with managing specific finance-related functions.

The role for an Ocean Sustainability Bank

The proposed partnership structure for BBNJ could be effectively supported through a dedicated multilateral ocean finance institution, such as the proposed Ocean Sustainability Bank. Just as the UN climate finance process gained traction through the creation of the Green Climate Fund³⁸, sustainable ocean finance needs an effective, well-resourced funding institution. The upcoming 27th Conference of the Parties (COP) of the United Nations Framework Convention on Climate Change (UNFCCC) offers the best chance to secure significant new global commitments to large-scale ocean finance for climate funding, based on the G7 Ocean Deal³⁹. This is key to address financing gaps⁴⁰ identified in the UNFCCC US\$100 billion Delivery Plan⁴¹.

41 Delivery Plan on the US\$100 billion goal presented by Canada and Germany to UNFCCC COP26

This policy brief argues that this opportunity should not be missed. An important component for the new institution could be to address the financing challenges of the High Seas, as well as delivering ocean project finance to support coastal resilience solutions and blue infrastructure⁴². Today's investment in physical, natural and knowledge capital to facilitate the conservation and restoration of ecosystems⁴³ is limited, in particular in the marine space⁴⁴. Development banks have a key role to play in future ocean finance as they have been spending more than US\$2 trillion per year⁴⁵ overall, are already working on common standards and have access to low cost, long term finance through capital markets.

This policy brief argues that a new institution can help to develop, in cooperation with existing development finance institutions and the private finance sector, large-scale blended finance approaches, act as a knowledge hub and agent of change⁴⁶. It recalls the approach taken with the launch of the European Bank for Reconstruction and Development (EBRD)⁴⁷ and multiple institutions have since emerged with different regional and sectoral focuses. Multilateralism remains key to unlocking the response for a new financial, societal and economic architecture⁴⁸. An early commitment to significant ocean finance investment will play an important role in helping to conclude an effective BBNJ Agreement.
